5 graph_metric

5.1 Constants

These constants are hard-coded to protect some numeric processes of hanging. They can be redefined during compilation, passing a flag such as
`-DGRAPH_METRIC_TOLERANCE=1E-3`.

5.1.1 GRAPH_METRIC_TOLERANCE

Error tolerance for numeric methods.

5.1.2 GRAPH_METRIC_MAX_ITERATIONS

Maximum number of iterations for numeric methods.

5.2 Component identification and extraction

5.2.1 `graph_undirected_components`

Label vertices' components treating edges as undirected.

Preconditions `label` must have dimension n .

Postconditions `label[i]` is the component ID of vertex v_i .

Return Number of components

For directed graphs, considers adjacencies as incidences. Labels start from 0 and are sequential with step 1. Component IDs are not ordered according to size.

5.2.2 graph_directed_components

Label vertices' components treating edges as directed. NOT IMPLEMENTED YET.

Preconditions `label` must have dimension n .

Postconditions `label[i]` is the component ID of vertex v_i .

Return Number of components

For undirected graphs, simply call `graph_undirected_components`. For directed graphs, two vertices v_i and v_j are in the same component if and only if

$$\begin{aligned}d(v_i, v_j) &\neq \infty \\d(v_j, v_i) &\neq \infty\end{aligned}$$

where $d(u, v)$ is the geodesic distance between them. In other words, they are in the same component if they are mutually reachable.

Labels start from 0 and are sequential with step 1. Component IDs are not ordered according to size.

5.2.3 graph_num_components

Extract number of components from label vector.

Preconditions

$n > 0$

`label` must have dimension n .

`label` must contain sequential IDs starting from 0.

Return Number of components

5.2.4 graph_components

Map components to vertices from label vector.

Preconditions

$n > 0$

`label` must have dimension n .

`label` must contain sequential IDs starting from 0.

`comp` must have size `num_comp` and all sets should be already initialized.

`graph_num_components(g) == num_comp`

Postconditions

If v_i is in component c_j , then

`label[i] == j` and

`set_contains(comp[j], i)` is true.

Return Number of components

5.2.5 graph_components

Creates a new graph from `g`'s largest component.

The guarantee of vertices' order ID is the same as `graph_subset`. If two or more components have the same maximum size, one will be chosen in an undefined way.

Return A new graph isomorphic to `g`'s largest component.

Memory deallocation

```
graph_t *largest = graph_components(g);
delete_graph(largest);
```

5.3 Degree metrics

5.3.1 graph_degree

List all vertices' degrees.

Preconditions `degree` must have dimension n .

Postconditions `degree[i]` is the degree of vertex v_i .

The degree of a directed graph's vertex is defined as the sum of incoming and outgoing edges.

5.3.2 graph_directed_degree

List all vertices' incoming and outgoing degrees.

Preconditions

`g` must be directed. `in_degree` must have dimension n . `out_degree` must have dimension n .

Postconditions

`in_degree[i]` is the number of incoming edges to vertex v_i . `out_degree[i]` is the number of outgoing edges from vertex v_i .

5.4 Clustering metrics

5.4.1 graph_clustering

List all vertices' local clustering.

Preconditions

`g` must be undirected.
`clustering` must have dimension n .

Postconditions `clustering[i]` is the local clustering coefficient of vertex v_i .

The local clustering coefficient is only defined for undirected graphs, and gives the ratio of edges between a vertex' neighbors and all possible edges.

Formally,

$$C_i = \frac{e_i}{\binom{k_i}{2}} = \frac{2e_i}{k_i(k_i - 1)}$$

where

C_i is the local clustering coefficient of vertex v_i .

e_i is the number of edges between v_i 's neighbors.

k_i is the degree of v_i .

If a vertex v_i has 0 or 1 adjacents, $C_i = 0$ by definition.

5.4.2 graph_num_triplets

Counts number of triplets and triangles (6 * number of closed triplets).

5.4.3 graph_transitivity

Compute the ratio between number of triangles and number of triplets.

5.5 Geodesic distance metrics

5.5.1 Definitions

5.5.2 graph_geodesic_distance

5.5.3 graph_geodesic_vertex

5.5.4 graph_geodesic_all

5.5.5 graph_geodesic_distribution

5.6 Centrality measures

5.6.1 graph_betweenness

5.6.2 graph_eigenvector

5.6.3 graph_pagerank

5.6.4 graph_kcore

5.7 Correlation measures

5.7.1 graph_degree_matrix

5.7.2 graph_neighbor_degree_vertex

5.7.3 graph_neighbor_degree_all

5.7.4 graph_knn

5.7.5 graph_assortativity
